EPIJAY

EOPXY THINNER

A mixture of aromatic solvents in suitable proportion formulated for mixing with epoxy paint products to obtain desired brushability / spraying viscosity.

The thinner can be added to the paint 5% to 10% of its quantity. The quantity of thinner being consumed depends on prevailing temperature, application methods, nature of surface and weather condition.

Adding a small percentage of extra thinner does not necessarily impair the film properties but excess thinning increases the quantity of liquid paint without contributing to solid content.

The volume solid after thinning should be calculated and the resultant coverage worked out to achieve the desired film thickness.
